CCCCCCCXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX	ADRIO601 standard; peptide; 15 AA. ADRIO601; 21-OCT-2004 (first entry) Dog IgE epitope recognised by monoclonal antibody 5. Antiasthmatic; Antiallergic; Immunosuppressive; IgE; anaphylactic shock; 5.91 monoclonal antibody; 3.76 m Canis familiaris. WO2004065936-A2. 05-AUG-2004. 15-JAN-2003; 2003US-0440472P. (UTNC-) UNIV NORTH CAROLINA STATE. Hammerberg B; WPI; 2004-593545/57. Novel antibody that specifically binds to mammalian for testing an allergen reactivity of IgE sample, de or treating asthma or anaphylactic shock. Example 6; Page 9; 14pp; English. The present invention relates to a novel monoclonal specifically binds to mammalian IgE epitope, where between amino acids 145-166 or 356-374 of mammalian (I) is useful for testing an allergen reactivity of and corn allergens. The sample is a biological sample dog, cat or horse. (I) is also useful for detecting and corn allergens. The sample is a biological sample dog, cat or horse. (I) is also useful for detecting
8888	treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclon antibodies recognise epitopes on canine IgE corresponding to amin residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively or the state of t

(I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and artifact atsthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY19994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for
cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 ware observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobulin limmunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergy; disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This polypeptide is encoded by exons 1-4 (see AAT79278) of canine IgE heavy chain constant region (epsilon) genomic DNA. Another polypeptide, comprising the exon 5 and 6 product, is given in AAW23068. Recombinant peptides encoded by exons 1-6 can be produced in eukaryotic or prokaryotic cells. Such peptides, and antibodies raised against them, a used in methods to treat the manifestation of allersy in dogs, e.g. to treat Type I immediate hypersensitivity, and for immunomodulation

The present invention describes a method (M1) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin E [IgB], comprising providing a test peptide (T) suspected of being able to bind to major histocompatibility complex (WHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to naturally processed and presented IgE peptides, where a peptide that induces such a response is identified. Also described are compositions: (C1) comprising at least one immunogenic peptide (I) identified by (M1); (C2) comprising at least one isolated polymicleotide encoding (I); and (C3) comprising antiqen-presenting cells that recognise at least one (I). Where C1-3 are able to bind to at least one MHC class I molecule and to elicit in a mammal a CTL response to naturally processed and presented IgE peptides. C1-3 have antiallargic, antiasthmatic, immunosuppressive, vasotropic, dermatological, antiallargic, antiasthmatic, immunosuppressive, vaccines. C1-3 can be used for modulating an IgE-mediated condition in a mammal. C1-3 are useful for modulating an IgE-mediated condition such as IgE-mediated anti-proposition of the condition, IgE-mediated non-atopic of the condition of the condition in the condition of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hypersensitivity condition, IgE myeloma in a mammal. Preferably, Cl-3 are useful for treating atopic hypersensitivity conditions (such as allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       atopic hypersensitivity conditions (such as anaphylaxis, and urticaria hives).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-146 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADRIGOGI) and 146-162 (ADRIGOGO) respectively of the canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian IgE or treating asthma or anaphylactic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the pig IgE 5.91 recognition site.
                                                                                                                                                                                                                                                Antiasthmatic; Antiallergic; Immunosuppressive; IgE; dog; asthma; anaphylactic shock; 5.91 monoclonal antibody; 3.76 monoclonal antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes a method (M1) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin (CC that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin (CC to bind to major histocompatibility complex (MHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to induces such a response is identified. Also described are compositions: (CC) comprising at least one immunogenic peptide (I) identified by (M1); (C2) comprising at least one immunogenic peptide (I) identified by (M1); (C2) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encodic (I) and (CC) comprising at least one isolated polynucleotide encodic (I); and (CC) comprising at least one isolated polynucleotide encodic (I); and (CC) comprising an inducers of actIL response against IgE, and in command (I) are useful for modulating an IgE-mediated condition in a compositivity condition, IgE myeloma in a mammal. Preferably, CI-3 are useful for treating atopic hypersensitivity condition; IgE-mediated one-atopic characting atopic hypersensitivity conditions (such as anaphylaxis, and urticaria atopic hypersensitivity conditions (such as anaphylaxis, and urticaria conditions). The present sequence represents an IgE-mediated acopic hypersensitivity conditions (such as anaphylaxis, and urticaria conditions). In this is allergic asthma, food allergies, or atopic dermaticaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

```
The invention describes an isolated nucleic acid molecule (I) encoding a portion of a feline IgE heavy chain protein. The methods and compositions of the present invention are useful for eliciting feline immune responses for and/or treating IGE-mediated responses, such as allergies. This is the amino acid sequence of a cat immunoglobulin E (IgE) constant region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunoglobulin E, vaccine, IgE, cytotoxic T lymphocyte response; immune response; major histocompatibility complex; MHC; immunogenic; antiallergic; antiaethmatic; immunosuppressive; vasotropic; cytostatic; dermatological; antiinflammatory; IgE-mediated condition; food allergy; atopic hypersensitivity condition; allergic rhinitis; allergic asthma; atopic dermatitis; non-atopic hypersensitivity condition; anaphylaxis;
                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid molecule encoding a portion of a feline igB heavy chain protein, useful for treating and/or eliciting feline immur responses for IGE-mediated responses, such as allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cat IgE heavy chain amino acid sequence SEQ ID NO:25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 48; DB 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian IgE or treating asthma or anaphylactic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the cat IgE 5.91 recognition site.
                                                                                                                        Antiasthmatic; Antiallergic; Immunosuppressive; IgE; dog; asthma; anaphylactic shock; 5.91 monoclonal antibody; 3.76 monoclonal antibody;

                                                                                                                                                                                                                                                                                                                                         The present invention describes a method (M1) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin E [192], comprising providing a test peptide (T) suspected of being able to bind to major histocompatibility complex (MHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to naturally processed and presented IgS peptides, where a peptide that induces such a response is identified. Also described are compositions: (C1) comprising at least one immunogenic peptide (I) identified by (M1); (C2) comprising at least one immunogenic peptide (I) identified by (M1); (C3) comprising antigen-presenting cells that recognise at least one (I). Where C1-3 are able to bind to at least one MHC class I molecule and to elicit in a mammal a CTL response to naturally processed and presented ISE peptides. C1-3 have antiallergic, antiasthmatic, immunosuppressive, vasotropic, dermatological, antiinflammatory and cytostatic activities, and can be used as inducers of a CTL response against IgE, and in mammal. C1-3 are useful for modulating an IgE-mediated condition in a mammal. C1-3 are useful for modulating an IgE-mediated non-atopic to the constitution of the mammal of the mediated of the modulating an IgE-mediated non-atopic to the constitution of the mammal of the condition in a mammal. C1-3 are useful for modulating an IgE-mediated non-atopic to the constitution of the mammal of the condition in a mammal can be used as inducers of a CTL response against IgE-mediated non-atopic to the condition of the mammal can be used an object of the condition of the mammal can be used as inducers of a CTL response against IgE-mediated on-atopic to the condition of the mammal can be used as inducers of a CTL response against IgE-mediated non-atopic to the condition of the mammal can be used as inducers of a CTL response against IgE-mediated non-atopic condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hypersensitivity condition, IgE myeloma in a mammal. Preferably, Cl-3 are useful for treating atopic hypersensitivity conditions (such as allergic rhinitis, allergic asthma, food allergies, or atopic dermatitis), nonatopic hypersensitivity conditions (such as anaphylaxis, and urticaria hives). The present sequence represents an IgE heavy chain amino acid sequence, which is given in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Feline, immunoglobulin E; IgE epsilon heavy chain; parasitic infection; IgE-mediated immune response; allergy; neoplasia; vaccine technology; antibody technology; antiallergic; antiparasitic; cytostatic.
                                                                                                 Identifying peptides that induce cytotoxic T-lymphocyte, CTL response against IgE, by identifying peptide eliciting CTL response to IgE peptides naturally presented by major histocompatibility complex class

                                                                           New nucleic acid molecule encoding feline immunoglobulin E (IgE) heavy or light chain protein, useful for treating feline IgE-mediated responses e.g. allergies, parasitic infections or neoplasia.
                                                                                                                                                                            The present invention relates to the isolation of feline immunoglobulin (IgB) kappa light chain and IgB epsilon heavy chain proteins, and the polynucleotide sequences encoding them. The sequences of the invention are useful for treating feline IgB-mediated immune responses (e.g. allergies, parasitic infections or neoplasia), in vaccine technology, small molecule/antibody technology, molecular biology, and various immunological techniques related to feline IgB and its functions. The present sequence represents feline IgB epsilon heavy chain #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Feline, immunoglobulin B; IgE epsilon heavy chain; parasitic infection; IgE-mediated immune response; allergy; neoplasia; vaccine technology; antiallergic; antiparasitic; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "This sequence is given as SEQ ID No:14 and is specifically claimed in Claim 12" 284. .309

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                       ö
                                                                                                            The present invention relates to the isolation of feline immunoglobulin E (IgE) kappa light chain and IgE epsilon heavy chain proteins, and the polymucleotide sequences encoding them. The sequences of the invention are useful for treating feline IgE-mediated immune responses (e.g. allergies, parasitic infections or neoplasia), in vaccine technology, amall molecule/antibody, technology, molecular biology, and various immunological techniques related to feline IgE and its functions. The present sequence represents feline IgE epsilon heavy chain #1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an isolated nucleic acid molecule (I) encoding a portion of a feline IgE heavy chain protein. The methods and compositions of the present invention are useful for eliciting feline immune responses for and/or treating IGE-mediated responses, such as allergies. This is the amino acid sequence of a partial cat immunoglobulin E (IgE) heavy
                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid molecule encoding a portion of a feline IgE heavy chain protein, useful for treating and/or eliciting feline immune responses for IGE-mediated responses, such as allergies.
                                           New nucleic acid molecule encoding feline immunoglobulin E (IgE) heavy light chain protein, useful for treating feline IgE-mediated responses e.g. allergies, parasitic infections or neoplasia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes an isolated nucleic acid molecule (I) encoding a portion of a feline IgE heavy chain protein. The methods and compositions of the present invention are useful for eliciting feline immune responses for and/or treating IGE-mediated responses, such as allergies. This is the amino acid sequence of a partial cat immunoglobulin E (IGE) heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid molecule encoding a portion of a feline IgE heavy chain protein, useful for treating and/or eliciting feline immune responses for IGE-mediated responses, such as allergies.

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 70437; 1766pp; English.

the 6213 antisenes sequences given in the specification where expression of the 6213 antisenes esquences given in the specification where expression of the nucleic acid inhibits proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway compared for proliferation or that has an activity against a biological pathway in which a proliferation or the test compound that inhibits spoilferation of an organism acts; (9) manufacturing an antibiotis; (10) profiling a gene required for required for collular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, sactivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to by which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits profileration of an organism. The antisense mucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the sequences. The invention relates to an isolated nucleic acid comprising any one of

Sequence 4012-101.
Sequence 4013. Application US/09134001C
Patent No. 6380370
GENERAL INFORMATION:
APPLICAVT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US 60/064,964
PRIOR FILING DATE: 1998-08-13
PRIOR APPLICATION NUMBER: US 60/055,779
PRIOR APPLICATION UNMBER: US 60/055,779
PRIOR APPLICATION STATE 1997-08-14
NUMBER FOR SEQ ID NOS: 5674
SEQ ID NO 4053
LENGTH: 533
                                                                                                                                                    US-09-479-614-29
US-09-479-614-29

Squence 29, Application US/09479614

Patent No. 6573372

GENERAL INFORMATION:

APPLICANT: McCall, Catherine

APPLICANT: Weber, Eric

TITLE OF INVENTION: Feline Immunoglobulin E Molecules and Related Methods

FILE REPRENCE: P-1047

CURRENT APPLICATION NUMBER: US/09/479,614

CURRENT FILING DATE: 2000-01-07

NUMBER OF SEQ ID NOS: 34

SOFTWARE: Patentin Ver. 2.0

SQ ID NO 29

LENGTH: 496

TYPE: RRT

US-09-206-942-63
US-09-206-942-63
Sequence 63, Application US/09206942
Patent No. 6432669
GENERAL INFORMATION:
APPLICANT: LOOSMORE. Sheena M.
APPLICANT: LOOSMORE. Sheena M.
TITLE OF INVENTION: Protective Recombinant Haemophilus Influenzae High
TITLE OF INVENTION: Molecular Weight Proteins
FILE REFERENCE: 1038-861 MIS:jb
CURRENT APPLICATION NUMBER: US/09/206,942
CURRENT APPLICATION NUMBER: 09/167,568
EARLIER PILING DATE: 1998-10-07
NUMBER OF SEQ ID NOS: 95
SOFTWARE: PatentIN Ver. 2.1
SEQ ID NO 63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              APPLICANT: Loosmore, Sheena M.

Patent No. 6562958

GENERAL INFORMATION:

APPLICANT: GATY L. Breton et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER

TITLE OF INVENTION: BAUMANNI FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: BAUMANNI FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/328,352

CURRENT APPLICATION NUMBER: US/09/328,352

SEQ ID NOS: 8252

SEQ ID NO 4294
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GENERAL INFORMATION:

Published_Applications Mucleic Acid and Published_Applications Amino Acid database searches now generate two sets of results each. The Published_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published_Applications_New databases; older published applications make up the Published_Applications_New databases; older published

Searches run against Nucleic Acid Published_Applications produce two sets of results, with the extensions **.rnpbm** (Published_Applications_NA_New). Searches run against Amino Acid Published_Applications produce two sets of results, with the extensions **.rapbm** (Published_Applications_AA_New).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1

Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian IgE or treating asthma or anaphylactic shock.

Example 6; Page 9; 14pp; English.

The present invention relates to a novel monoclonal antibody (1) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (1) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (1) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the

The methods and compositions of the present invention are useful for eliciting feline immune responses for and/or treating IGE-mediated responses, such as allergies. This is the amino acid sequence of a cat immunoglobulin E (IgE) constant region.
canine IGE epsilon-chain. Recognition of epsilon-chains from IGE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 ware observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IGE. The present sequence is the cat IGE 5.91 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid molecule encoding a portion of a feline IgB heavy chain protein, useful for treating and/or eliciting feline immune responses for IGE-mediated responses, such as allergies.

The present invention describes a method (M1) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin (CC E (IgE), comprising providing a test peptide (TT) suspected of being able to bind to major histocompatibility complex (MHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to naturally processed and presented IgE peptides, where a peptide that induces such a response is identified. Also described are compositions: (CI) comprising at least one immunogenic peptide (I) identified by (M1); (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) comprising at least one isolated polynucleotide encoding (I); and (CC) are able to bind to at least one MHC class I molecule and to elicit in a mammal a CTL response to naturally processed and presented (CC) elicit in a mammal a CTL response to naturally processed and presented (CC) and can be used as inducers of a CTL response against IgE, and in a composition such as an encountered atopic hypersensitivity condition, IgE-mediated condition in a companient of the presential condition, IgE myeloma in a mammal. Preferably, Cl-3 are useful for treating atopic hypersensitivity conditions (such as allergic ribinitis, allergic asthma, food allergies, or atopic dermatitis), nonthic atopic hypersensitivity conditions (such as allergic at the present seminary perpensions and an applylants, and and a condition and an adaphylants, and an encounted perpension and ada
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying peptides that induce cytotoxic T-lymphocyte, CTL response against IgE, by identifying peptide eliciting CTL response to IgE peptides naturally presented by major histocompatibility complex class I

New nucleic acid molecule encoding feline immunoglobulin E (IgE) heavy or light chain protein, useful for treating feline IgE-mediated responses e.g. allergies, parasitic infections or neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the isolation of feline immunoglobulin E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (IgB) kappa light chain and IgB epsilon heavy chain proteins, and the polymuclectide sequences encoding them. The sequences of the invention are useful for treating feline IgB-mediated immune responses (e.g. allergies, parasitic infections or neoplasia), in vaccine technology, small moleculefantibody technology, molecular biology, and various immunological techniques related to feline IgB and its functions. The present sequence represents feline IgB epsilon heavy chain #1
     IgE-mediated immune response; allergy; neoplasia; vaccine technology; antibody technology; antiallergic; antiparasitic; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of feline immunoglobulin E (IgB) kappa light chain and IgB epsilon heavy chain proteins, and the polynucleotide sequences encoding them. The sequences of the invention are useful for treating feline IgB-mediated immune responses (e.g. allergies, parasitic infections or neoplasia), in vaccine technology, anleucule antibody technology, molecular biology, and various immunological techniques related to feline IgB and its functions. The present sequence represents feline IgB epsilon heavy chain #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or

                                                                                                                                                                                                                                                                                  The invention describes an isolated nucleic acid molecule (I) encoding a portion of a feline IgE heavy chain protein. The methods and compositions of the present invention are useful for eliciting feline immune responses for and/or treating IGE-mediated responses, such as allergies. This is the amino acid sequence of a partial cat immunoglobulin E (IgE) heavy
                                                                                                                                                                                                                     New isolated nucleic acid molecule encoding a portion of a feline IgE heavy chain protein, useful for treating and/or eliciting feline immune responses for IGE-mediated responses, such as allergies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 156-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal artibodies recognise epitopes on canine IgE corresponding to amino acid residues 157-371 (ADR10601) and 146-162 (ADR10609) respectively of the canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from
                                                                                                                                      The invention describes an isolated nucleic acid molecule (I) encoding a portion of a feline IgE heavy chain protein. The methods and compositions of the present invention are useful for eliciting feline immune responses for and/or treating IGE-mediated responses, such as allergies. This is the amino acid sequence of a partial cat immunoglobulin E (IgE) heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian IgE or treating asthma or anaphylactic shock.
New isolated nucleic acid molecule encoding a portion of a feline IgE heavy chain protein, useful for treating and/or eliciting feline immune responses for IGE-mediated responses, such as allergies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-asthmatic; asthma; anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

This polypeptide is encoded by exons 1-4 (see AAT79278) of canine IgE heavy chalan constant region (epsilon) genomic DNA. Another polypeptide, comprising the exon 5 and 6 product, is given in AAW23068 Recombinant peptides encoded by exons 1-6 can be produced in eukaryotic or profused in peptides, and antibodies raised against them, are used in methods to treat the manifestation of allergy in dogs, e.g. to treat Type I immediate hypersensitivity, and for immunomodulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated canine IgE heavy chain constant region DNA - useful to develop products for treatment of canine allergies and for immunomodulation in

The cloning of the IgE gene allows produ. of large quantities of recombinant IgE using bacterial, yeast, mammalian, insect or vixal systems. The IgE can be used in drug development (e.g. small molecule screening, assay development and anti-IgE antibody generation). Fragments of IgE can be used in vaccines or to prevent IgS-mediated hypersensitivity. The new sequence information permits targeted modulation of IgE-mediated immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New DNA encoding canine IgE and IgA - useful in vaccines, anti-sense therapy, assays, drug screening, etc.

C1-3 have antiallergic, antiasthmatic, immunosuppressive, vasocropic, dermatological, antialifammaerory and cytostatic activities, and can be used as inducers of a CTL response against 1gE, and in vaccines. C1-3 can be used for modulating an IgE-mediated condition in a mammal. C1-3 are useful for modulating an IgE-mediated condition such as IgE-mediated atopic hypersensitivity condition, IgE-mediated non-atopic hypersensitivity condition, IgE-mediated non-atopic hypersensitivity conditions (such as allergic rathma, food allergies, or atopic dermatitis), non-atopic hypersensitivity conditions (such as allergic sathma, food allergies, or atopic dermatitis), non-atopic hypersensitivity conditions (such as anaphylaxis, and urticaria hives). The present sequence respresents an IgE heavy chain amino acid sequence, which is given in an example from the present invention
The present invention describes a method (M1) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin E (IgE), comprising providing a test peptide (T) suspected of being able to bind to major histocompatibility complex (MHC) class I molecule, and naturally processed and presented IgE peptides, where a peptide that induces such a response is identified. Also described are compositions: (C1) comprising at least one immunogenic peptide (I) identified by (M1); (C2) comprising at least one isolated polynucleotide encoding (I); and (C3) comprising antigen-presenting cells that recognise at least one isolated polynucleotide and compositions: (C3) camprising antigen-presenting cells that recognise at least one (I); where C1-3 are able to bind to at least one MHC class I molecule and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
